

Create a Java class named FoodOrder contain variables customerName, foodItem, unitPrice, quantity

A non-parameterized, non-return method named displayOrder() to display all order details.

A parameterized, non-return method named updateQuantity(int newQuantity) to update the quantity.

A non-parameterized, return method named calculateSubtotal() to calculate and return the subtotal.

A parameterized, return method named calculateFinalTotal(double discountPercentage) to calculate and return the final total after applying a discount.

Use the following formulas:

$\text{Subtotal} = \text{unit price} \times \text{quantity}$

$\text{Discount} = \text{subtotal} \times \text{discount percentage} \div 100$

$\text{Final total} = \text{subtotal} - \text{discount}$

Inside the main() method:

Create a FoodOrder object.

Assign suitable values to its variables.

Call all four methods.

Display the subtotal and final total.
